

WEATHER APP – INTERNSHIP TASK SUBMISSION

Name: Saumya Srivastav

Task Title: Weather Forecast Widget using OpenWeatherMap
API

Internship Domain: Front-End Development

Submission Format: folder via Google Drive

Navodita Infotech

1. Project Description

This is a web application for weather prediction and it enables users to check real-time weather conditions of any city in the world. It uses OpenWeatherMap API to obtain the data and present it on an attractive responsive user interface.

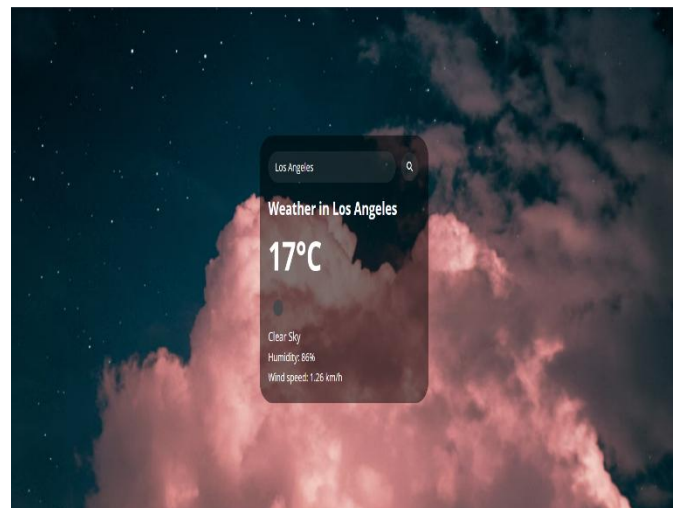

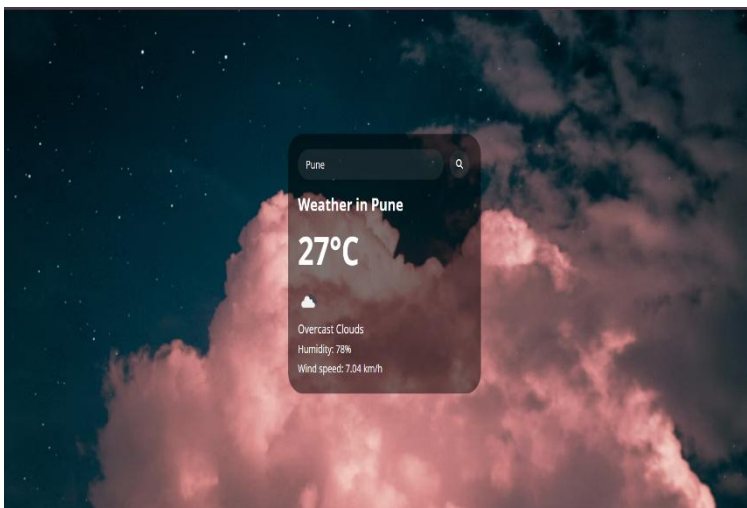

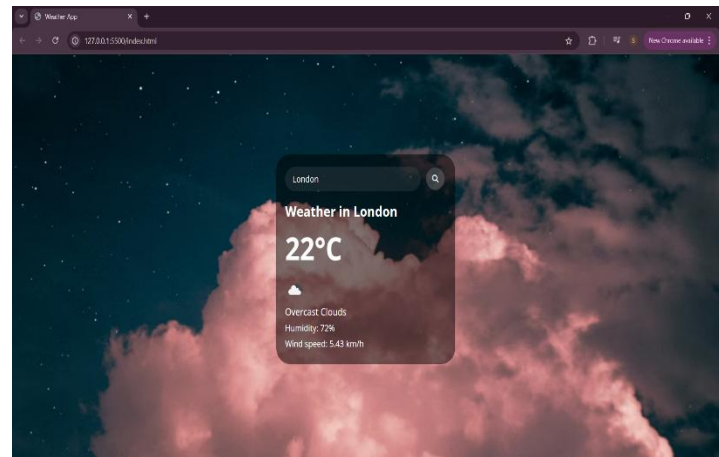

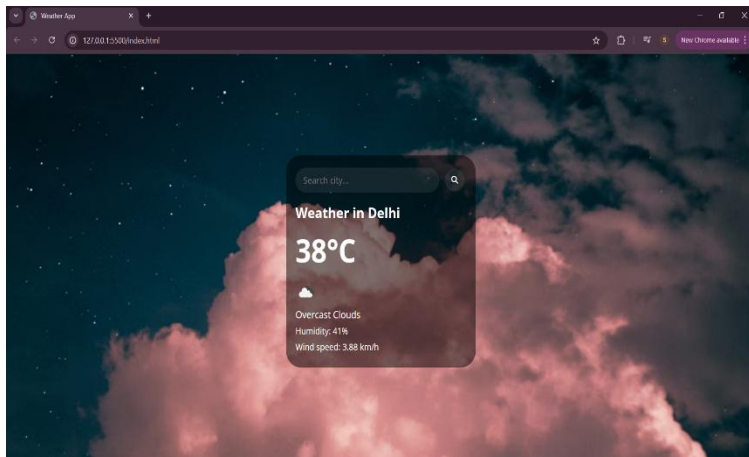

The application also provides the following features:

- ✓ Current temperature in degree Celsius
 - ✓ Weather icon with a short description
 - ✓ City name
 - ✓ Wind speed measurement
 - ✓ Humidity level as percentages
 - ✓ Real time search option with the use of city name
-

2. Technologies Used

- HTML – for page structure
 - JavaScript – for API calls and DOM manipulation
 - CSS – for styling and layout
 - OpenWeatherMap API – to retrieve live weather data
 - Unsplash.com – for background image
 - Google Fonts & Font Awesome – for icons and typography
-

This is how the widget looks

3.How It Works

- The application retrieves weather information for a preset city (Delhi) during the initial page load.
 - Users are able to enter any city name in the search bar.
 - After submission, either through clicking the button or hitting Enter, the application retrieves and displays real-time weather information for that city via a fetch() call to OpenWeatherMap API.
 - The entire process is done seamlessly without requiring page reloads. The DOM is updated dynamically with all information and UI elements respond immediately upon correct or incorrect user input.
-

4.Evaluation and Findings

- Valid cities yield accurate weather data retrieval.
 - Invalid entries trigger an alert: “No weather found...”
 - Styling is responsive and the pages are clean across different browsers.
-

5.Submitted files in folder

- index.html
 - style.css
 - script.js
 - launch.json
 - Documentation report
 - Weather app demo video
-
